Experiment-4

String Handling Using Raptor

Aim:

To design a flowchart using Raptor to display and return the total number of characters present in a given string.

Procedure:

1. Open Raptor and create a new flowchart.

2. Design flowchart steps:

• Input a string from the user

• Store the string in a variable

• Find the length of the string

• Display the total number of characters

3. Add flowchart logic:

• Use Input Symbol to accept the string

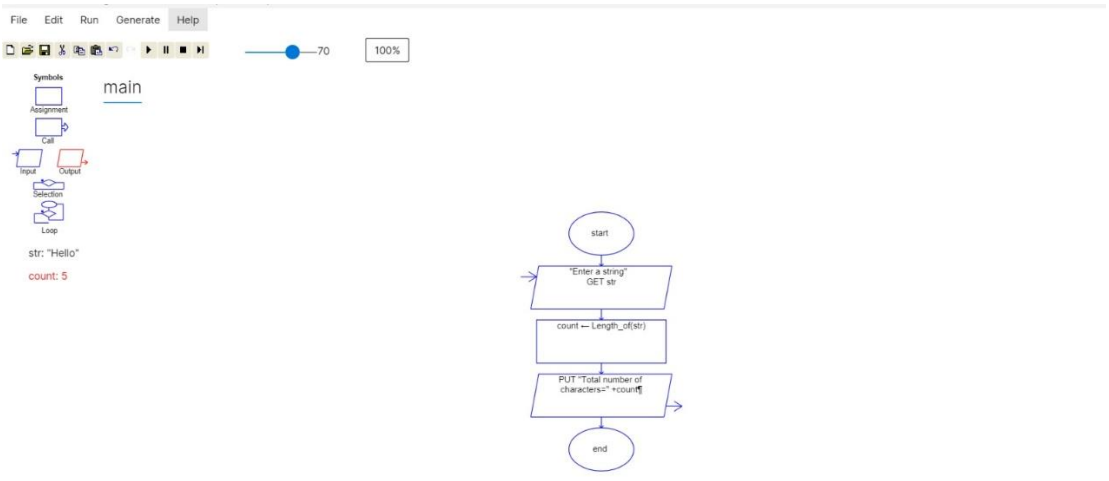

• Use Assignment Symbol to calculate character count

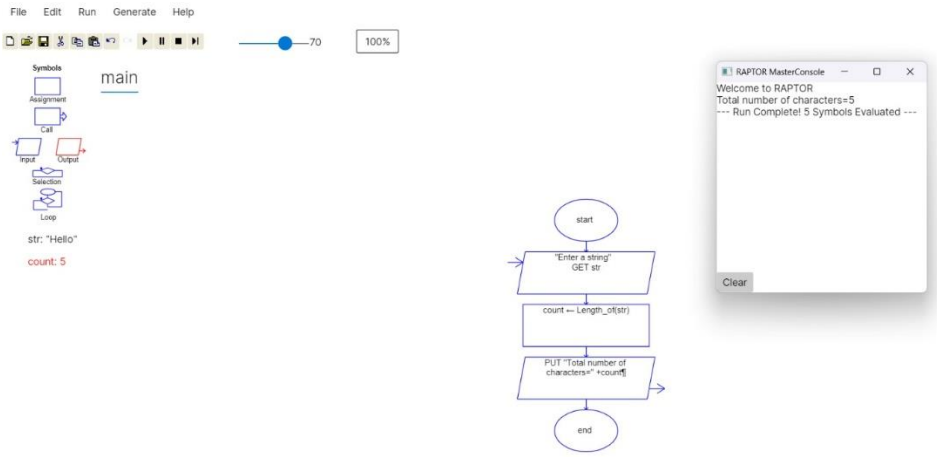

Example:

count ← Length(str)

• Use Output Symbol to display the count

4. Execute and validate the flowchart using different string inputs.

Result:

Thus, the flowchart for displaying and returning the total number of characters in a string was created and validated successfully using Raptor.
