Experiment 7- MoSCoW and Kano Prioritisation in Jira

Aim:

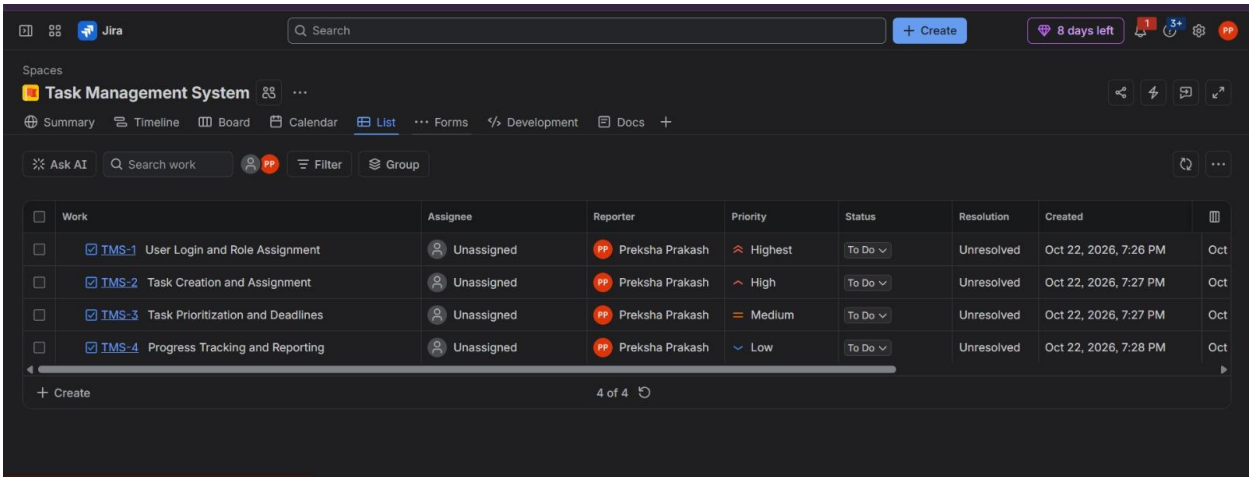

To categorize and prioritize the functional requirements of a Task Management System in Jira Software using the MoSCoW and Kano analysis frameworks.

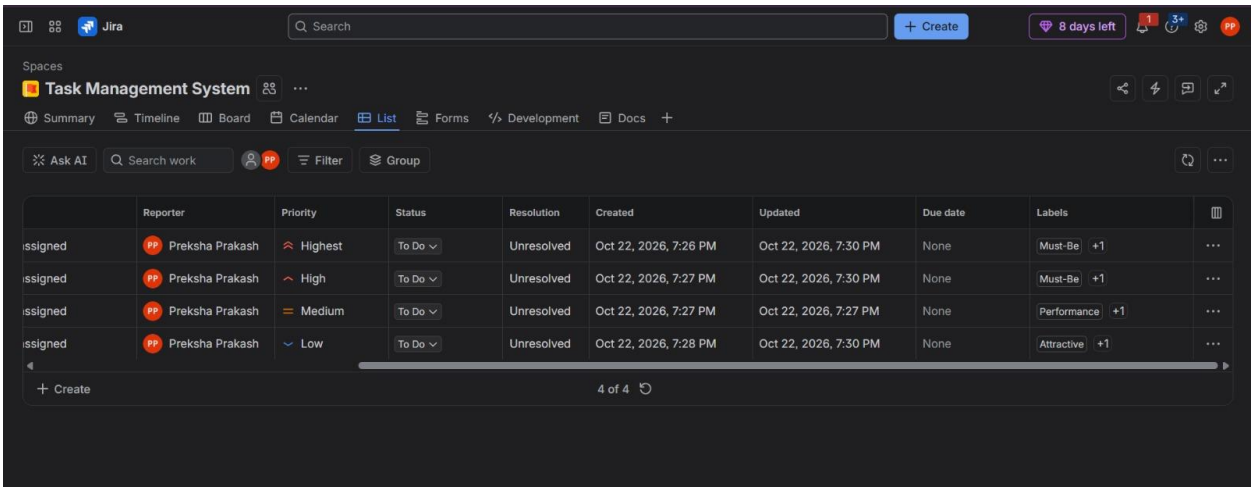

Procedure:

1. Create Project: Open Jira Software, create a new space/project using the Kanban template, and name it Task Management System (Key: TMS).
2. Define Requirements: Click + Create to add the 4 functional requirements as tasks/stories:

- User Login and Role Assignment
- Task Creation and Assignment
- Task Prioritization and Deadlines
- Progress Tracking and Reporting

3. Assign MoSCoW & Kano Labels: For each task, open the Labels field and assign the corresponding MoSCoW (Must-Have, Should-Have, Could-Have) and Kano (Must-Be, Performance, Attractive) tags.
4. Set Priority Levels: Set the Jira Priority field for each requirement according to its MoSCoW classification (Highest/High for Must-Have, Medium for Should-Have, Low for Could-Have).
5. Configure View & Capture: Switch to the List view, ensure the Priority and Labels columns are enabled and visible, and capture the summary table.

Result:

Successfully configured, categorised, and prioritised the 4 core requirements for the Task Management System in Jira Software using MoSCoW and Kano prioritisation techniques.
